

Level crossing systems

Optimise your level crossing systems

Level crossings have an important part to play in communities, helping to maintain safety for third parties and others. Infranord can help you with production and maintenance of most level crossing systems.

Although doing away with level crossings as far as possible is desirable, the fact remains that people have to be able to cross railways sensibly. Level crossings have an important part to play in this regard.

Good level crossings have to meet a range of criteria. The amount of time lost by both rail traffic and road traffic should be as small as possible, while at the same time maintaining a high level of safety.

Extensive experience and efficient processes

No matter what level crossings you need for your site, it is important to design and maintain them effectively. Infranord has expertise in full barrier and half barrier systems, as well as an entire range of audible and visual systems. We can help you with maintenance, upgrades and fine tuning as well as expansions and new construction.

Efficient production in the field and at our own workshop

Here at Infranord, we are well aware that track time is tight when level crossings are to be maintained or constructed out in the field. We have developed efficient processes over the years which guarantee good results, while of course also meeting Swedish Transport Administration requirements. Many of our customers benefit from having their level crossings prefabricated at Infranord's own workshop in Nässjö, for example. At the workshop, our experienced staff have the opportunity to devote a little more attention to the fine details, while also allowing you to reduce the amount of track time needed for implementation.

What does it cost?

It is worth booking us to produce level crossings off-season. Manufacturing level crossings indoors in winter when we have spare capacity allows us to reduce your costs and cut back on the time required for installation in the field.

✓ Supplementary services

As well as implementing level crossing systems, we also work with:

- Fault rectification

“ My overall impression of Infranord is that they build really good level crossing systems. We have around 140 level crossings on the inland railway line, Inlandsbanan. Infranord replaces seven or eight of these every year and does a thorough job.”

Jörgen Jonsson
Signal engineer, Inlandsbanan AB

Expertise in all level crossing systems

Years of experience
